Rappels #1 (probabilités)

Fonction de répartition et quantiles

Let X denote a random variable, its cumulative distribution function (c.d.f.) is

$$F(x) = \mathbb{P}(X \le x)$$
, for all $x \in \mathbb{R}$.

More formally, $F(x) = \mathbb{P}(\{\omega \in \Omega | X(\omega) \le x\})$. Observe that

- \triangleright F is an increasing function on \mathbb{R} with values in [0,1],
- $\lim_{x \to -\infty} F(x) = 0 \text{ and } \lim_{x \to +\infty} F(x) = 1.$

Let X denote a random variable, its quantile function is

$$Q(p) = F^{-1}(p) = \inf\{x \in \mathbb{R} \text{ such that } F(x) > p\}, \text{ for all } p \in [0, 1].$$

Densité

Let X be a random variable. The density or probablity function of X is

$$f(x) = \begin{cases} \frac{dF(x)}{dx} = F'(x) \text{ in the (absolutely) continous case, } x \in \mathbb{R} \\ \mathbb{P}(X = x) \text{ in the discret case, } x \in \mathbb{N} \\ dF(x), \text{ in a more general context} \end{cases}$$

Example: if $X \sim \mathcal{U}_{[0,1]}$, $f(x) = \mathbf{1}_{[0,1]}(x)$, $x \in \mathbb{R}$.

Moments (Espérance & Variance)

$$\mathbb{E}[Y] = \int_{\mathbb{R}} yf(y) \, dy$$
, ou $\sum_{y \in \mathbb{N}} yf(y)$ dans le cas discret

La version empirique, pour un échantillon $\{y_1, y_2, \dots, y_n\}$ est

$$\overline{y} = \sum_{i=1}^{n} y_i \frac{1}{n} = \frac{1}{n} \sum_{i=1}^{n} y_i$$

$$Var[Y] = \mathbb{E}[(Y - \mathbb{E}[Y])^2] = \int_{\mathbb{R}} (y - \mathbb{E}[Y])^2 f(y) dy,$$

Note: $Var[Y] = \mathbb{E}[Y^2] - \mathbb{E}[Y]^2$.

La version empirique, pour un échantillon $\{y_1, y_2, \dots, y_n\}$ est

$$s^2 = \sum_{i=1}^n (y_i - \overline{y})^2 \frac{1}{n} = \frac{1}{n} \sum_{i=1}^n (y_i - \overline{y})^2$$

Vecteur aléatoire

Let $\mathbf{Z} = (X, Y)$ be a random vector. The cumulative distribution function of \mathbf{Z} is

$$F(\mathbf{z}) = F(x, y) = \mathbb{P}(X \le x, Y \le y)$$
, for all $\mathbf{z} = (x, y) \in \mathbb{R} \times \mathbb{R}$.

Let $\mathbf{Z} = (X, Y)$ be a random vector. The density of \mathbf{Z} is

$$f(\mathbf{z}) = f(x,y) = \begin{cases} \frac{\partial^2 F(x,y)}{\partial x \partial y} & \text{in the continuous case, } \mathbf{z} = (x,y) \in \mathbb{R}^2 \\ \mathbb{P}(X = x, Y = y) & \text{in the discrete case, } \mathbf{z} = (x,y) \in \mathbb{N}^2 \end{cases}$$

Note:

$$\mathsf{Var}(\mathbf{Z}) = \mathbb{E}\big[(\mathbf{Z} - \mathbb{E}[\mathbf{Z}])(\mathbf{Z} - \mathbb{E}[\mathbf{Z}])^{\mathsf{T}} \big] = \begin{pmatrix} \mathsf{Var}[X] & \mathsf{Cov}[X,Y] \\ \mathsf{Cov}[X,Y] & \mathsf{Var}[Y] \end{pmatrix}$$

Lois Binomiales

$$Y \sim \mathcal{B}(p)$$
:

$$\mathbb{P}[Y = y] = p^{y} (1 - p)^{1 - y} \begin{cases} p \text{ si } y = 1 \\ 1 - p \text{ si } y = 0 \end{cases}, \text{ où } y \in \{0, 1\}$$

cf loi de Bernoulli, où $p = \mathbb{P}[Y = 1] = \mathbb{E}[Y] \in [0, 1]$.

$$Y \sim \mathcal{B}(n,p)$$
:

$$\mathbb{P}[Y = y] = \binom{n}{y} p^y (1 - p)^{n - y} \text{ où } y \in \{0, 1, 2, \dots, n\}$$

cf loi binomiale, où $\mathbb{E}[Y] = np$.

$$Y_1, \dots, Y_n$$
 i.i.d. $\mathcal{B}(p)$ alors $Y = \sum_{i=1}^n Y_i \sim \mathcal{B}(n, p)$

Lois Binomiales

$$Y \sim \mathcal{B}(n, p)$$
:

$$\mathbb{P}[Y=y] = \binom{n}{y} p^{y} (1-p)^{n-y}$$

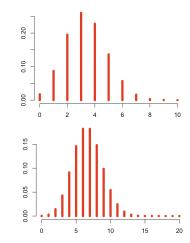

où $y \in \{0, 1, 2, \dots, n\}$ cf loi binomiale, où $\mathbb{E}[Y] = np$ et Var[Y] = np(1-p). Note: when $pn \sim \lambda$ and n large enough,

$$\mathcal{B}(n,p) \approx \mathcal{P}(\lambda)$$
, where $\lambda = \frac{p}{n}$

and when $n \to \infty$,

$$\mathcal{B}(n,p) \approx \mathcal{N}(np, np(1-p))$$

(see Galton's quincunx)

Lois Binomiales & Multinomiales

$$\mathbf{Y}=(Y_1,\cdots,Y_d)\sim\mathcal{M}(\mathbf{p})$$
 où $\mathbf{p}=(p_1,\cdots,p_d)$ si
$$Y_1+\cdots+Y_d=1 \text{ et } Y_j\sim\mathcal{B}(p_j), \ \forall j\in\{1,\cdots,d\}$$
 i.e. $\mathbf{Y}=(\mathbf{1}_{C_1},\mathbf{1}_{C_2},\cdots,\mathbf{1}_{C_d})$

$$\mathbf{Y} = (Y_1, \dots, Y_d) \sim \mathcal{M}(n, \mathbf{p}) \text{ où } \mathbf{p} = (p_1, \dots, p_d) \text{ si}$$

$$Y_1 + \cdots + Y_d = n \text{ et } Y_j \sim \mathcal{B}(n, p_j), \forall j \in \{1, \cdots, d\}$$

cf loi multinomiale. Pour

$$(y_1, \dots, y_d) \in \mathcal{S}_{d,n} = \{(y_1, \dots, y_d) \in \mathbb{N}^d : (y_1 + \dots + y_d = n)\}$$

$$\mathbb{P}[(Y_1, \dots, Y_d) = (y_1, \dots, y_d)] = \frac{n!}{v_1! \dots v_d!} p_1^{y_1} \dots p_d^{y_d}$$

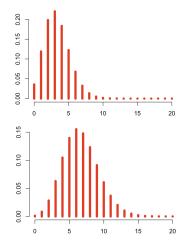

Example:
$$\mathbf{Y} = (Y_0, Y_1) \sim \mathcal{M}(n, \mathbf{p})$$
 où $\mathbf{p} = (p_0, p_1)$.

Lois de Poisson

$$Y \sim \mathcal{P}(\lambda)$$
:

$$\mathbb{P}[Y=y]=e^{-\lambda}\frac{\lambda^y}{y!}$$

où $y \in \{0, 1, 2, \dots\}$ cf loi de Poisson, où $\mathbb{E}[Y] = \lambda$ et $Var[Y] = \lambda$. Note: si $Y \sim \mathcal{P}(\lambda)$, $\mathbb{P}[Y = 0] = e^{-\lambda}$, aussi $\lambda = -\log \mathbb{P}[Y = 0]$.

Distribution Géométrique

 $Y \sim \mathcal{G}(p)$:

$$\mathbb{P}[Y=y]=p(1-p)^y$$

où $y \in \{0, 1, 2, ...\}$ cf loi géométrique,

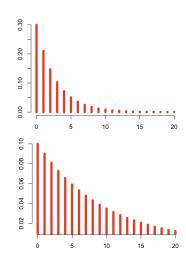

$$\mathbb{E}[Y] = \frac{1}{\rho} - 1 \text{ and } \mathsf{Var}[Y] = \frac{1-\rho}{\rho^2}$$

Note: possible alternative representation

$$\mathbb{P}[Y=y]=p(1-p)^{y-1}$$

où $y \in \{1, 2, ...\}$, et dans ce cas

$$\mathbb{E}[Y] = \frac{1}{p}$$
 and $Var[Y] = \frac{1-p}{p^2}$

Distribution Exponentielle

$$Y \sim \mathcal{E}(\lambda)$$
:

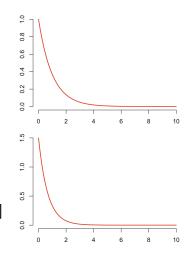

$$f(y) = \lambda e^{-\lambda y}$$
 ou $\mathbb{P}[Y > y] = e^{-\lambda y}$

où $y \in \mathbb{R}_+$, cf loi exponentielle,

$$\mathbb{E}[Y] = \frac{1}{\lambda}$$
 and $Var[Y] = \frac{1}{\lambda^2}$

Absence de mémoire: pour h > 0,

$$\mathbb{P}[Y > y + h|Y > y] = \frac{e^{-\lambda(y+h)}}{e^{-\lambda h}} \mathbb{P}[Y > h]$$

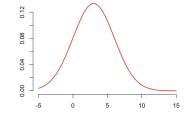

Distribution Gaussienne

$$Y \sim \mathcal{N}(\mu, \sigma^2)$$
:

$$f(y) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{(y-\mu)^2}{2\sigma^2}\right)$$

où $y \in \mathbb{R}$, cf loi normale,

$$\mathbb{E}[Y] = \mu$$
 and $Var[Y] = \sigma^2$

Si
$$Z \sim \mathcal{N}(0,1)$$
, $Y = \mu + \sigma Z \sim \mathcal{N}(\mu, \sigma^2)$, et $\frac{Y - \mu}{\sigma} \sim \mathcal{N}(0,1)$.

Note:
$$\mathbb{P}[Z \le z] = \Phi(z) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{z} \exp\left(-\frac{x^2}{2}\right) dx$$

- 1 > pnorm(1.96)
- 2 [1] 0.9750021
- 3 > qnorm(.95)
- 4 [1] 1.644854

Distribution Log-Normale

$$Y \sim LN(\mu, \sigma^2)$$
:

$$f(y) = \frac{1}{y\sqrt{2\pi\sigma^2}} \exp\left(-\frac{\left[\log(y) - \mu\right]^2}{2\sigma^2}\right)$$

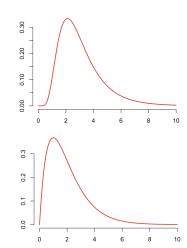

où $y \in \mathbb{R}_+$, cf loi log-normale,

$$\mathbb{E}[Y] = \exp\left(\mu + \frac{\sigma^2}{2}\right)$$

$$\mathsf{Var}[Y] = (e^{\sigma^2} - 1) \exp(2\mu + \sigma^2)$$

Si
$$Y \sim LN(\mu, \sigma^2)$$
, $\log Y \sim \mathcal{N}(\mu, \sigma^2)$

Note: $\mathbb{E}(\log Y) \neq \log \mathbb{E}(Y)$

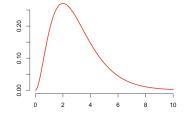

Distribution Gamma

$$Y \sim \mathcal{G}(\alpha, \beta)$$
:

$$f(y) = y^{\alpha-1} \frac{\beta^{\alpha} e^{-\beta x}}{\Gamma(\alpha)}$$

où $y \in \mathbb{R}_+$, cf loi gamma,

$$\mathbb{E}[Y] = \frac{\alpha}{\beta}$$
 et $Var[Y] = \frac{\alpha}{\beta^2}$

 α est appelé *shape* et β *rate*

Note: si $X \sim \mathcal{G}(\nu/2, 1/2)$ alors $X \sim \chi^2(\nu)$, cf loi du chi-deux.

Convergence

The sequence (X_n) converges in probability towards X, denoted $X_n \stackrel{\mathbb{P}}{\to} X$, if

$$\forall \varepsilon > 0$$
, $\lim_{n \to \infty} \mathbb{P}(|X_n - X| > \varepsilon) = 0$.

Let $f: \mathbb{R} \to \mathbb{R}$ be a continuous function, if $X_n \stackrel{\mathbb{P}}{\to} X$ then $f(X_n) \stackrel{\mathbb{P}}{\to} f(X)$. More generally, let $f: \mathbb{R} \times \mathbb{R} \to \mathbb{R}$ be a continuous function, if $X_n \stackrel{\mathbb{P}}{\to} X$ and $Y_n \stackrel{\mathbb{P}}{\to} y \in \mathbb{R}$ then $f(X_n, Y_n) \stackrel{\mathbb{P}}{\to} f(X, y)$ (Slutsky Theorem).

A sufficient condition to have $X_n \stackrel{\mathbb{P}}{\to} a$ is that

$$\lim_{n\to\infty} \mathbb{E}[X_n] = a \text{ and } \lim_{n\to\infty} \operatorname{Var}(X_n) = 0$$

Suppose X_i 's are i.i.d. with finite expected value $\mu = \mathbb{E}(X_i)$, then $\overline{X}_n \stackrel{\mathbb{P}}{\to} \mu$ as $n \to +\infty$, see Law of Large Numbers

Convergence

Sequence (X_n) converges in distribution towards X, denoted $X_n \xrightarrow{\mathcal{L}} X$. if for any continuous function h

$$\lim_{n\to\infty}\mathbb{E}\left[h\left(X_{n}\right]\right)=\mathbb{E}\left(h\left(X\right)\right).$$

Convergence in distribution is the same as convergence of distribution function $X_n \stackrel{\mathcal{L}}{\to} X$ if for any $t \in \mathbb{R}$ where F_X is continuous

$$\lim_{n\to\infty}F_{X_{n}}\left(t\right) =F_{X}\left(t\right) .$$

Let $X_1, X_2 \dots$ denote i.i.d. random variables with mean μ and variance σ^2 , then :

$$\frac{\overline{X}_n - \mathbb{E}(\overline{X}_n)}{\sqrt{\mathsf{Var}(\overline{X}_n)}} = \sqrt{n} \left(\frac{\overline{X}_n - \mu}{\sigma} \right) \xrightarrow{\mathcal{L}} X \text{ where } X \sim \mathcal{N}(0, 1)$$

see Central Limit Theorem

Transformation

Let X be an absolutely continuous random variable with density f(x). If function ϕ is a differentiable one-to-one mapping, then variable $Y = \phi(X)$ has a density g satisfying

$$g(y) = \frac{f(\phi^{-1}(y))}{\phi'(\phi^{-1}(y))}.$$

Let X be an absolutely continuous random variable with cdf F, i.e. $F(x) = \mathbb{P}(X \le x)$. Then Y = F(X) has a uniform distribution on [0, 1].

Let Y be a uniform distribution on [0,1] and F denote a cdf. Then $X = F^{-1}(Y)$ is a random variable with cdf F.

Delta Method

In the univariate case, if there is a sequence of random variables X_n satisfying $\sqrt{n}[X_n - \theta] \xrightarrow{\mathcal{L}} \mathcal{N}(0, \sigma^2)$, where θ and σ^2 are two constants, then

$$\sqrt{n}[g(X_n) - g(\theta)] \xrightarrow{\mathcal{L}} \mathcal{N}(0, \sigma^2 \cdot [g'(\theta)]^2)$$

for any function g satisfying the property that $g'(\theta)$ exists and is non-zero valued.

In the multivariate case, if there is a sequence of random vectors \mathbf{X}_n satisfying $\sqrt{n}[\mathbf{X}_n - \theta] \xrightarrow{\mathcal{L}} \mathcal{N}(\mathbf{0}, \Sigma)$, where θ is a vector in \mathbb{R}^d and Σ is a symmetric positive $d \times d$ matrix, then

$$\sqrt{n}[g(\mathbf{X}_n) - g(\theta)] \xrightarrow{\mathcal{L}} \mathcal{N}(\mathbf{0}, \nabla g(\theta)^\mathsf{T} \Sigma \nabla g(\theta))$$

for any function g satisfying the property that $\nabla g(\theta)$ exists and is non-zero valued.
